Quiz, 10 questions

3. Hyperparameter tuning Batch Normalization Programming Frameworks in Quaradelication is largely determined by:	
	Whether you use batch or mini-batch optimization
	The presence of local minima (and saddle points) in your neural network
0	The amount of computational power you can access
Correct	
	The number of hyperparameters you have to tune
<b>~</b>	1/1 point
	hink $eta$ (hyperparameter for momentum) is between on 0.9 and 0.99, which of the following is the mended way to sample a value for beta?
	1 r = np.random.rand() 2 beta = r*0.09 + 0.9
0	1 r = np.random.rand() 2 beta = 1-10**(- r - 1)
Corre	ect
	1 r = np.random.rand() 2 beta = 1-10**(- r + 1)
	1 r = np.random.rand() 2 beta = r*0.9 + 0.09

1/1 point

5.

Finding good hyperparameter values is very time-consuming. So typically you should do it once at the start of the project, and try to find very good hyperparameters so that you don't ever have to revisit tuning them again. True or false?

False

Correct

1/1 point

6.

In batch normalization as presented in the videos, if you apply it on the lth layer of your neural network, what are you normalizing?

 $z^{[l]}$ 

#### Correct

1/1 point

7.

In the normalization formula  $z_{norm}^{(i)}=rac{z^{(i)}-\mu}{\sqrt{\sigma^2+arepsilon^2}}$  why do we use epsilon?

12/20/2018 Improving Deep Neural Networks: Hyperparameter tuning, Regularization and Optimization - Home | Coursera To have a more accurate normalization Hyperparameter tuning, Batch Normalization, Programming Frameworks Quiz, 10 que  $\theta_t$   $\theta_t$   $\theta_t$  is too small To avoid division by zero Correct To speed up convergence 1/1 point 8. Which of the following statements about  $\gamma$  and  $\beta$  in Batch Norm are true? They can be learned using Adam, Gradient descent with momentum, or RMSprop, not just with gradient descent. Correct  $\beta$  and  $\gamma$  are hyperparameters of the algorithm, which we tune via random sampling. **Un-selected** is correct They set the mean and variance of the linear variable  $z^{|l|}$  of a given layer. Correct The optimal values are  $\gamma = \sqrt{\sigma^2 + \varepsilon}$ , and  $\beta = \mu$ .

# **Un-selected is correct**

There is one global value of  $\gamma\in\Re$  and one global value of  $\beta\in\Re$  for each layer, and applies to all the hidden units in that layer.

**Un-selected** is correct

uiz, 10 qı 9.	uestions	
After training a neural network with Batch Norm, at test time, to evaluate the neural network on a new example you should:		
	If you implemented Batch Norm on mini-batches of (say) 256 examples, then to evaluate on one test example, duplicate that example 256 times so that you're working with a mini-batch the same size as during training.	
0	Perform the needed normalizations, use $\mu$ and $\sigma^2$ estimated using an exponentially weighted average across mini-batches seen during training.	
Correct		
	Skip the step where you normalize using $\mu$ and $\sigma^2$ since a single test example cannot be normalized.	
	Use the most recent mini-batch's value of $\mu$ and $\sigma^2$ to perform the needed normalizations.	
<b>~</b>	1/1 point	
10. <b>Which</b> (	of these statements about deep learning programming frameworks are true? (Check all that apply)	
	A programming framework allows you to code up deep learning algorithms with typically fewer lines of code than a lower-level language such as Python.	
Correct		
	Deep learning programming frameworks require cloud-based machines to run.	
Un-selected is correct		
	Even if a project is currently open source, good governance of the project helps ensure that the it remains open even in the long term, rather than become closed or modified to benefit only one company.	
Correct
